# 1 Introduction

Accurate time information is crucial for the analysis of the STRV–REM data. Not primarily for properly locating events on the time axis but because the time tells us the position of the spacecraft. Position again is used for calculating magnetic field and L-value. Thus the accurate time is needed to link the measured particle fluxes to the magnetic coordinates.

STRV–REM observation times are measured with the STRV–1B spacecraft clock. After launch it has been recognized that the clock had not survived the launch totally unscathed and that it was running too slow. The REM observation times thus have to be corrected for this fact.

## 2 STRV–1B spacecraft time – Universal time UT

During launch the frequency of the STRV–1B spacecraft clock oscillator has obviously been shifted. Although no direct measurements of this shift have been made it is clear that the clock is retarded. We assume that the rate shift has been constant throughout the mission. This assumption seems reasonable and there exist no indications that this may not be valid.

The time delay  $t_{\text{delay}}$  of the spacecraft–clock with respect to real time per period of time  $\Delta t$  is given by

$$t_{\text{delay}} = a \cdot \Delta t \quad (1)$$

Note: the shifted clock rate is  $f_0/(1+a)$  where  $f_0$  is the nominal clock rate in units of Hz.

Regularly, generally during each ground contact, the spacecraft clock is synchronized with the clock of the ground commanding computer. This is done by sending a clock set command which sets the spacecraft clock to a defined time  $T0$ . The set command is issued at ground at a time such that the clock-set should be executed at time  $T0$  (transmission time is taken into account). However, varying transmission times, delays between command issue and transmission, and inaccuracies of the ground computer clock cause that the spacecraft–clock set command is not executed at time  $T0$  but at time  $T0 + \Delta T0$ . The situation is illustrated in figure 1. The horizontal axis shows Universal time (UT) and the vertical axis the spacecraft time. The thick bold line represents the spacecraft time. The diagonal line represents a perfectly synchronized clock.

The following relation holds between spacecraft clock time  $t'$  and UT  $t$ :

$$t = t' + (t - (T0 + \Delta T0)) \cdot a + \Delta T0 \quad (2)$$

which can be solved for  $t$

$$t = t' + \frac{a}{(1-a)} \cdot (t' - T0) + \Delta T0 \quad (3)$$

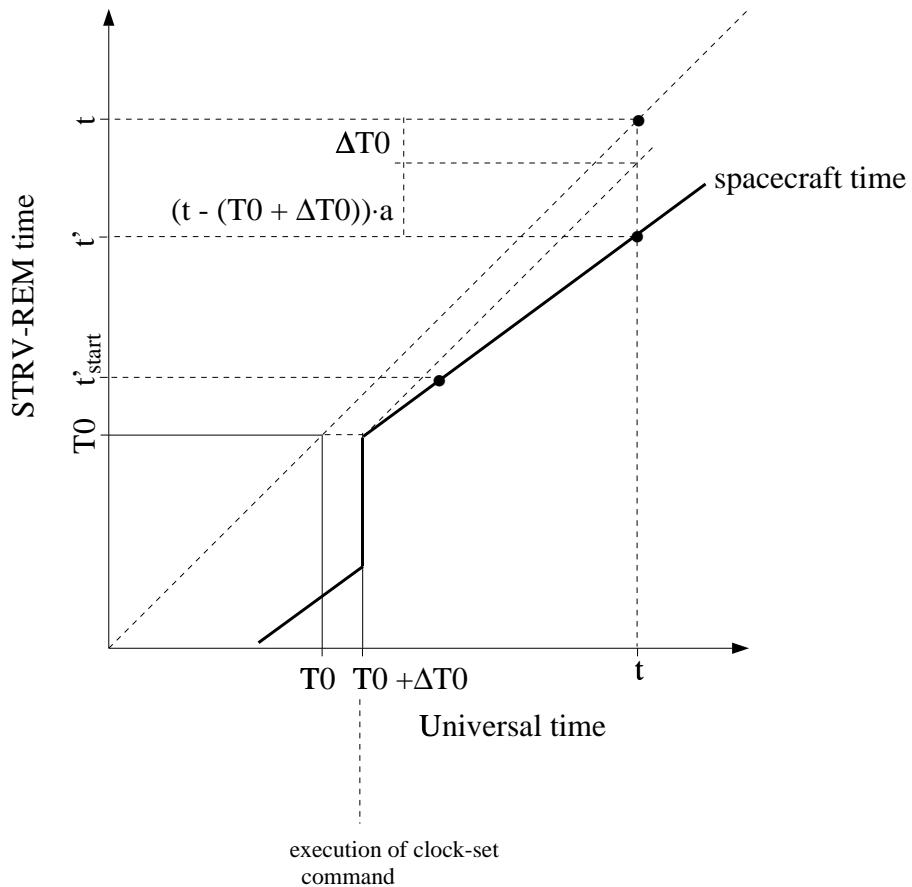

Figure 1: Illustration of the relation between STRV-REM time,  $t'$  and real time,  $t$ . At UT  $T_0 + \Delta T_0$  REM time is set to  $T_0$ . From then on the REM time is delayed with a rate of  $a$  seconds per second.

### 3 Observation time correction

In order to calculate real time from STRV–REM time (equation (3)), the clock–rate shift  $a$ , and for each observation the relevant clock–set information ( $T0$  and  $\Delta T0$ ) have to be known.

#### 3.1 $T0$ , $a$ , and $\Delta T0$

Information on  $T0$  has been provided by DRA. Fortunately the spacecraft commandings have been recorded and saved, so important information could be extracted. DRA has provided a list containing for each REM run, besides others, the relevant reset time  $T0$ .

$a$  and  $\Delta T0$  are not known a priori and must be determined by other means. However, various checks have shown that  $a$  can be assumed to be constant throughout the whole mission and  $\Delta T0$  can normally not be neglected.

#### 3.2 $t'_{start}$ , $a$ , and $\Delta t'$

Instead of using  $T0$  as reference point for the correction, also the start time of a run ( $t'_{start}$ ) can be used. This has the advantage, that  $T0$  is not needed and does not have to be gathered and saved as additional information. Since the spacecraft control has been handed over to the Americans  $T0$  is no longer provided (after 1 August 1996).

Rearrangement of equation (3) gives

$$\begin{aligned} t &= t' + \frac{a}{(1-a)} \cdot (t' - t'_{start} + t'_{start} - T0) + \Delta T0 \\ &= t' + \frac{a}{(1-a)} \cdot (t' - t'_{start}) + \left[ \Delta T0 - \frac{a}{(1-a)} \cdot (T0 - t'_{start}) \right] \\ &= t' + \frac{a}{(1-a)} \cdot (t' - t'_{start}) + \Delta t' \end{aligned} \tag{4}$$

Thus the unknown  $\Delta T0$  in equation (3) is replaced now by  $\Delta t'$ .

#### 3.3 Correction procedure

##### 3.3.1 The idea

The most time–sensitive part of the REM data is data accumulated around apogee (i.e. in the inner belt) because spacecraft velocity is maximal and accumulation times are short. Thus small timing errors already cause significant errors in the calculated spacecraft position and the magnetic parameters.

Trapped particle fluxes, especially in the inner radiation belt are well ordered by the magnetic field and the  $L$ –shell parameter. At a given  $L$  the omnidirectional particle flux, as measured with STRV–REM, is a monotonically decreasing function of  $B$ . This has the following consequence which can be used to check the correctness of the timing:

Assuming the trapped fluxes to be constant in time, or at least only to change slowly, the measured flux at a given  $L$ -value is only a function of  $B$ . Thus the fluxes measured at the same point in  $B$ - $L$ -space must be equal.

The inner radiation belt is suited for checking this behaviour because  $B$ -field and particle fluxes are rather stable in this region. Thus measurements from different epochs can be directly compared.

In the upper panel of figure 2, STRV-REM integral proton flux is plotted versus  $L$  for four passages through the inner belt on 23 August 1995.  $L$ -values have been calculated using the uncorrected observation times. In the lower panel of figure 2 the position of the spacecraft in  $B$ - $L$  plane is shown for the same measurements.

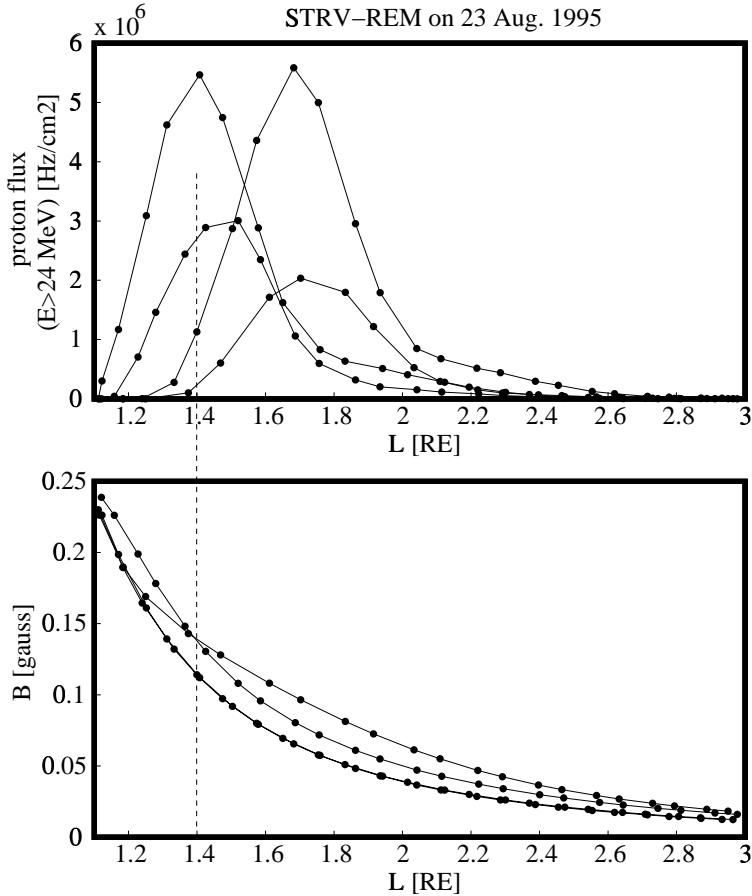

Figure 2: Demonstration of the STRV-REM time shift. Proton flux peaks (upper panel) of contiguous passages through the inner belt region are shifted with respect to each other.

The measurements are obviously not in agreement with the expected behaviour described above. The flux peaks are shifted against each other and the crossing point at  $L=1.4$  in the  $B$ - $L$ -plane has no corresponding crossing point in the upper panel.

The situation can be perfectly fixed by calculating the observation times with equation (5) and appropriate values for  $a$  and  $\Delta t'$ . The result is shown in figure 3. Now the inner belt passages with identical trajectory in  $B$ - $L$ -plane also cover in the flux- $L$ -plot and at  $L=1.4$ , where the trajectories of the other two passages cross, the fluxes are identical!

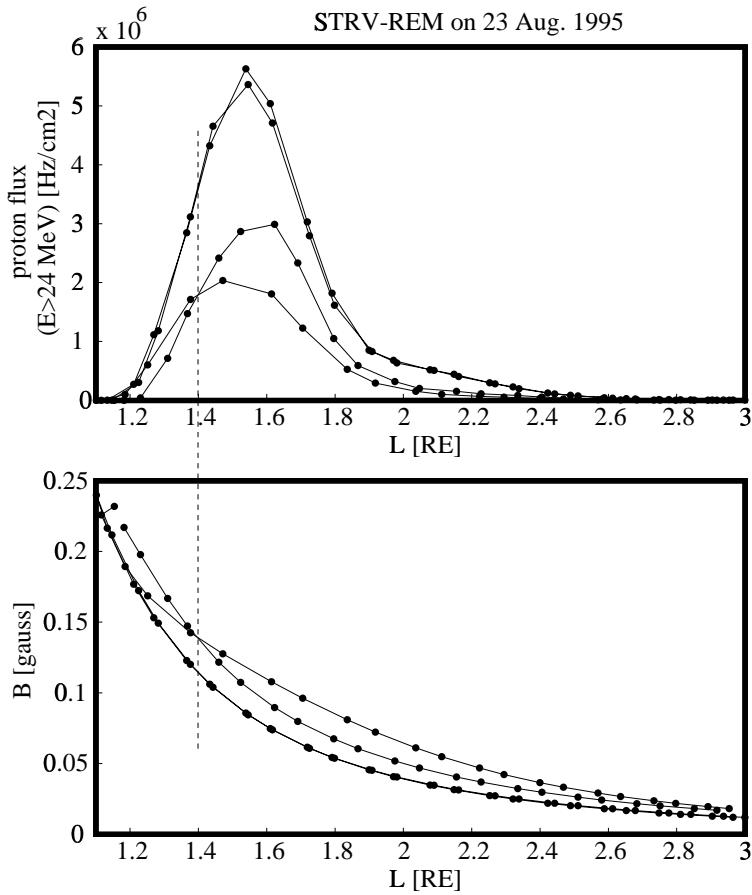

Figure 3: Same as figure 2 but now with correct observation times. The corrected data is in agreement with the expectations.

Note: using this method it is assumed that the orbit parameters and programs used for calculating the position of the satellite and the magnetic field model used for calculating  $B$  and  $L$  are correct. The fact that a simple time shift is sufficient to bring the data into agreement with the expected behaviour proves that the used models do very well approximate the real situation.

### 3.3.2 The procedure

**For each observation an  $a$  and  $\Delta T_0$  (or  $\Delta t'$ ) is determined, such that the corrected data behaves as is expected.**

This is done by a trial and error procedure for which a special software tool was developed. The procedure is illustrated in figure 4.

Four plots are used to analyze the data: (upper left) proton flux versus  $L$  at  $L < 3$ , (upper right) p-detector count rates versus  $L$  at  $L > 3$ , (lower left)  $B$  versus  $L$  at  $L < 3$ , and (lower

Figure No. 1

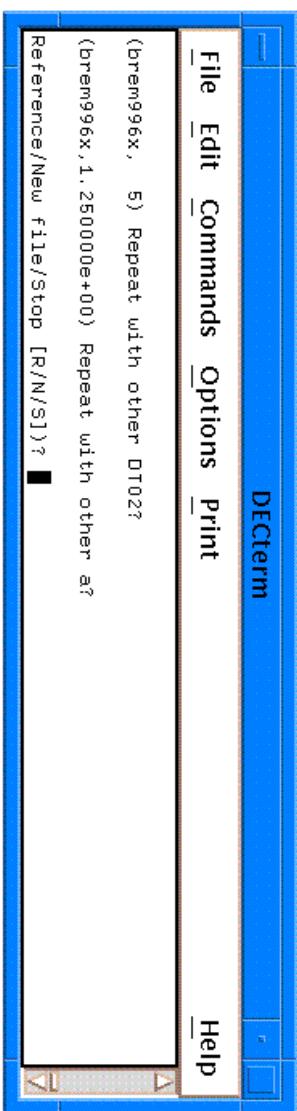

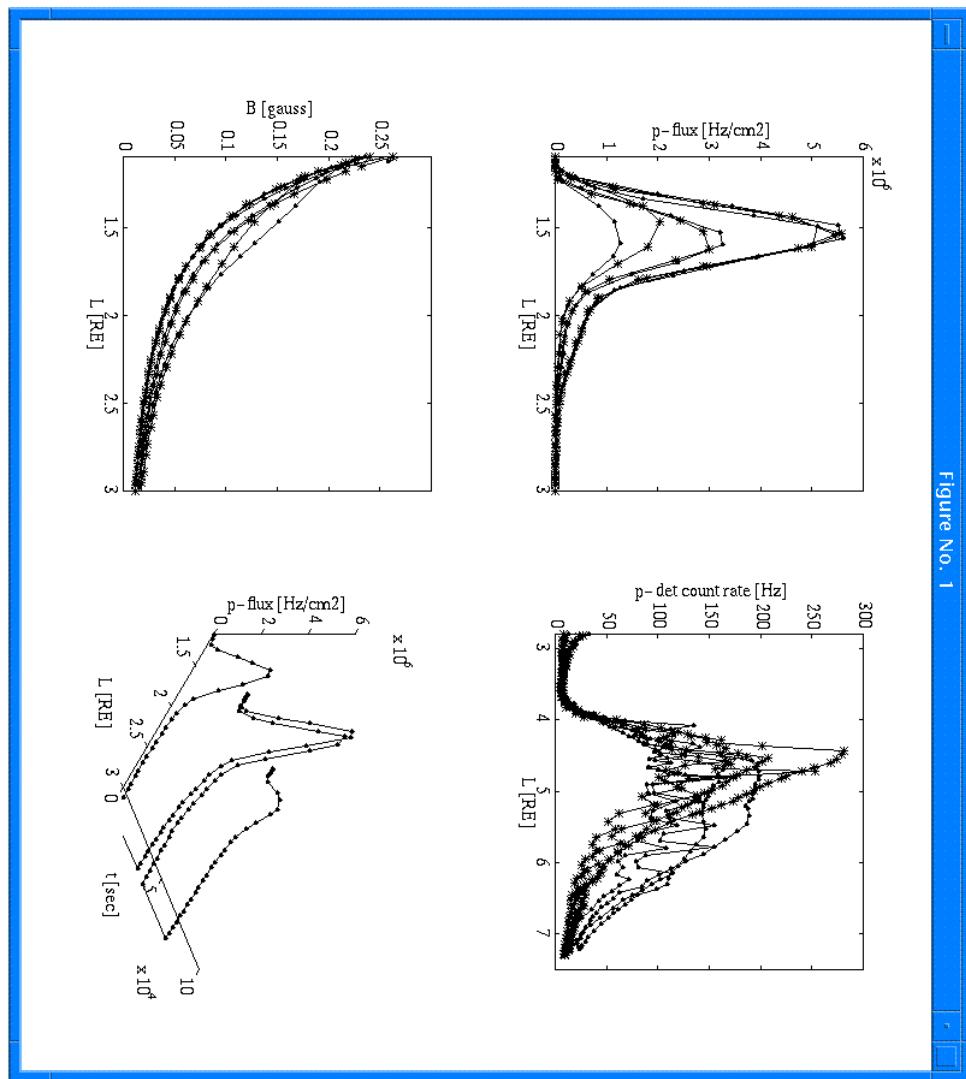

Figure 4: A software tool allows to find the time correction parameters  $a$  and  $\Delta t'$ . See text for details.

right) p-detector count rate versus time and  $L$  at  $L < 3$ .

The program works as follows:

- data for a reference observation file, which's observation times were corrected is calculated (normally data file brem154 is used, which needs no correction)
- data of file for which the parameters  $a$  and  $\Delta T_0$  ( $\Delta t'$ ) shall be determined is calculated using default  $a$  and  $\Delta t'$  values
- reference data and data to be checked are plotted as shown in figure 4, the reference data is represented by asterisks
- the values of  $a$  and  $\Delta T_0$  ( $\Delta t'$ ) are modified, observation times are corrected, and the plots updated until the times are judged to be correct
- the corrected data can be selected as new reference data and the procedure is repeated with the next observation file or the procedure is stopped

In such a way all data files have been corrected!

## 4 Results

Parameter  $a$ , describing the spacecraft-clock rate shift was found to be  $1.25 \cdot 10^{-3}$  which corresponds to 110 sec delay per day. A list of all STRV-REM observations with the  $T_0$  and  $\Delta T_0$  of the entire mission is given in Appendix A.

## 5 Appendix A

Table 1: List of STRV-REM observations with the  $T_0$  and  $\Delta T_0$  from July 1994 to August 1996
